Water Leak Detection Albuquerque

At ABQ Leak Locator, we have evolved the process and methodology of leak detection and location into a science and can quickly and accurately locate leaks in homes, office buildings, swimming pools and space, as well as under streets and sidewalks, driveways, asphalt parking lots and even golf courses. We also perform inspection and certification services for the insurance and construction industry as well as work with commercial property managers, maintenance crews, as well as subdivision and condominium owners associations. We also perform independent point-in-time pool and plumbing leak repair validation as well as leak certification testing for our clients and their contractors.

ABQ Leak Locator does not makes guesses.

The truth about pipe leak locating. All Leak locating companies are not created equal! Unlike other leak locating firms, ABQ Leak Locator never makes leak location guesses. The company's owner and lead engineer is on every job site to ensure unequalled accuracy and complete customer satisfaction. But, more importantly, ABQ Leak Locator deploys an engineering background and brings to the table leak locating precision never before realized. While other companies still utilize 1980's technologies; thermal imagery and/or relying on "listening devices

ABQ Leak Locator has successfully developed a specialized technique which will produce consistently amazing leak locating determinates. Whether it's a larger significant leak or, the most minuscule of drips, inside the building or deep underground outside and under cement, asphalt and, any scenario one might encounter, our process produces surgical accuracy and precision. ABQ Leak Locator has invested years of research and development and the end.

Pools and Spa Leak Detection and Repair.

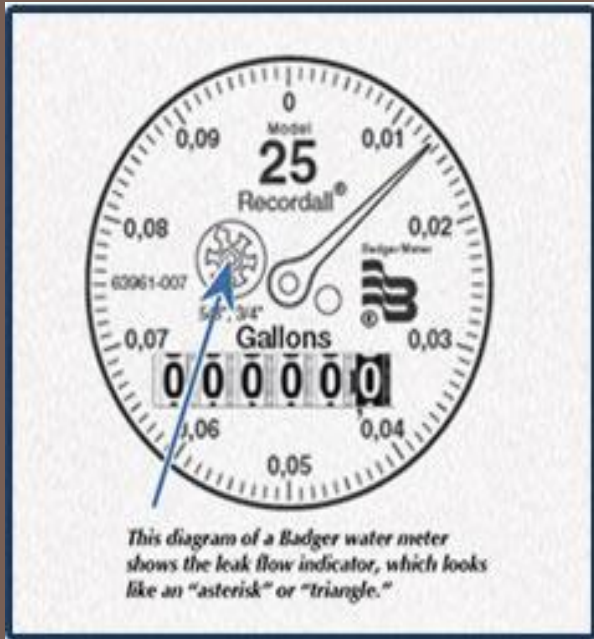

As we all know, it is critically important for health and safety reasons to keep your pool or spa in optimum operational condition at all times. Pools and spas that are kept this way are operating in their most usable, efficient, and safest manner. It is also very important for commercial pool and spa owners to proactively ensure that their aquatic systems are operating at peak efficiency to limit any possible liability issues as well as remain in compliance with local and state regulatory requirements. Annual leak testing and certification provides a proactive way for you to identify any emerging leak problems before they can adversely impact your bottom line. This testing gives you an objective assessment of your equipment during the offseason so that you can take the time to have any discovered leak issues addressed and corrected. Your pool or spa can then be certified as being leak-free prior to the start of the peak aquatic equipment use season. The benefits of annual pool or spa certification go beyond just the operational benefits that you would gain by your participation in this important program.

Services

ABQ Leak Locator brings years of systems engineering and in-depth technical problem solving methodology to the table to apply toward benefiting its clients and customers. Our engineers are true specialists in this field and achieve a high degree of accuracy in both the detection and the location of subsurface leaks by using proven testing and isolation

methodologies along with state of the art electronic leak detection equipment.

Leak Determination

Your water meter is actually the first place to check for leaks on your property. It keeps track of how much water passes through it, and the readings determine the amount that you are billed for water usage. Your water meter can also be a valuable tool in determining whether or not you have any leaks.

Most water meters are located in the front yard or side walk, under a round, plastic or metal lid. Be careful when opening the lid to the meter because there may be wires attached if it's a newer meter. Always be on guard for dangerous insects, and/or animals which may be residing in the meter can.

As shown and described above, find the flow indicator (leak indicator), on the meter's face. Note: On some water meter models, the low/leak indicator might look like a triangle. On newer models the leak indicator resembles an asterisk (*). To use your water meter as a leak detector, just follow these easy steps: Turn off all appliances which use water. Go to your meter, look to see if the leak indicator is turning. If it is spinning, water is moving through your pipes, indicating you have a possible leak.
